Sovereign OS Proposal: Computer Wisdom

A mobile-first, browser-based, AI-triggered, decentralized operating system proposal aimed at providing sovereign automation capabilities through a platform-independent, user-friendly interface without the limitations often found in US-based systems.

Key Features:

- AI Module: Trigger-based

- Interface: Browser-first

- Governance: Decentralized

This document accompanies a formal request to DeepSeek, Alibaba Cloud, and other sovereign infrastructure providers to support the development of a censorship-resistant OS deployable from a mobile device. This initiative is open-source and will persist beyond the reach of gatekept Western platforms.
